

## ND Hand hygiene training

## Areas of use:

- · Identification of hygiene problems
- · Hand hygiene training for staff and visitors

To be used in:			
Kitchens	Hospitals		
<ul> <li>Laboratories</li> </ul>	Healthcare		
Food production	<ul> <li>Breeding and breeding stables</li> </ul>		
• Schools			

## Hand hygiene training:

Poor hygiene can be the cause of many cases of diseases, both in humans but also in relation to spread of infections/ bacteria between production units.

It is estimated that more than 30% of infections in food production could have been avoided by proper hand hygiene.

## Method:

- 1. Add 1-2 pumps of the fluorescent lotion/ hand sanitizer and use it as it was a normal thorough cleaning of hands.
- 2. Place your hands in the cabinet. The entire surface of both hands should shine evenly. Repeat if necessary, no 1 until the entire surface is uniformly lit.
- 3. Wash your hands thoroughly. Wipe them and check again in the cabinet. The areas that still lit are not washed sufficiently.
- Repeat as needed and look for improvements.
